Interaction to Next Paint (INP)

web.dev/inp

**DON'T BLOCK
NEXT PAINT
AFTER INTERACTION**

Let's play a bit!

```
let maxDuration = 0;

new PerformanceObserver(list => {
  for (const entry of list.getEntries()) {
    // Comment this out to show ALL event entry types (useful e.g. on Firefox).
    if (!entry.interactionId) continue;

    if (entry.duration > maxDuration) {
      // New longest Interaction to Next Paint (duration).
      maxDuration = entry.duration;
      console.log(`[INP] duration: ${entry.duration}, type: ${entry.name}`, entry);
    } else {
      // Not the longest Interaction, but uncomment the next line if you still want to see it.
      // console.log(`[Interaction] duration: ${entry.duration}, type: ${entry.name}`, entry);
    }
  }
}).observe({
  type: 'event',
  durationThreshold: 16, // Minimum supported by the spec.
  buffered: true
});
```

Chrome DevTools Protocol

chromedevtools.github.io/devtools-protocol/

Navigation

Start typing to search...

The **Chrome DevTools Protocol** allows for tools to instrument, inspect, debug and profile Chromium, Chrome and other Blink-based browsers. Many existing projects [currently use](#) the protocol. The [Chrome DevTools](#) uses this protocol and the team maintains its API.

Instrumentation is divided into a number of domains (DOM, Debugger, Network etc.). Each domain defines a number of commands it supports and events it generates. Both commands and events are serialized JSON objects of a fixed structure.

Protocol API Docs

[The latest \(tip-of-tree\) protocol \(tot\)](#) – It [changes frequently](#) and can break at any time. However it captures the full capabilities of the Protocol, whereas the stable release is a subset. There is no backwards compatibility support guaranteed for the capabilities it introduces.

[v8-inspector protocol \(v8\)](#) – It is available in [node 6.3+](#) and enables [debugging & profiling](#) of Node.js apps.

[stable 1.3 protocol \(1-3\)](#) – The stable release of the protocol, tagged at Chrome 64. It includes a smaller subset of the complete protocol compatibilities.

[stable 1.2 protocol \(1-2\)](#) – The stable release of the protocol, tagged at Chrome 54. It includes a smaller subset of the complete protocol compatibilities.

Resources

[Getting Started with CDP](#)

The [devtools-protocol repo](#) issue tracker can also be used for concerns with the protocol. It also hosts the canonical copy of the json files.

Tim Vereecke
@TimVereecke

#INP is maybe not what you expect it to be!
Take this autocomplete example:

The page responds to user input as soon as the keystroke is painted in the <input> field.

The latency to fetch+paint the suggestions are not taken into account for INP!

Michal Mo... @mmo... · May 16 ···

Replying to [@TimVereecke](#)

That's a great example.

You are right, INP won't measure the time for autocomplete to update- just that first text update to the input field. If you blocked the text update on autocomplete, it would tank INP.

In this case we consider that a desirable effect. How about you?

1

3

Tim Vere... @TimVere... · May 16 ···

Yes I agree, it is a desirable effect for INP.

2

Dan Shap... @DanSh... · May 17 ···

Replying to [@TimVereecke](#)

It's exactly what I expected. But maybe I'm funny that way 🤪

Other effects

Good:

- Measures real effects, not an artificial score
- Doesn't grow over time (unless responsiveness tanks over time)

It's complicated:

- Route transitions measured as interactions, not navigations
- Longer time on page

Not so good:

- "Bleed" across routes
- Fewer Page Loads
