Speed Program 2017

rschoen@chromium.org, nduca@chromium.org bit.ly/speed-program-2017

2016 Accomplishments

Background & offscreen throttling

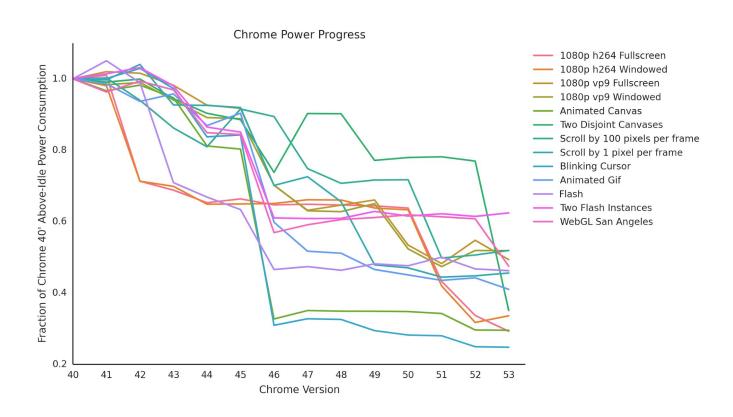

Document.write intervention

Among the 6% of affected 2G page loads:

- 10% increase in successful page loads
- o 35% reduction in median ParseStartToFirstContentfulPaint
- 52% reduction in median parse duration
- 7% decrease in page reloads

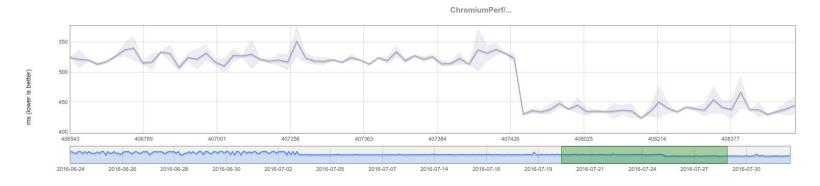

Across the entire web, **15% reduction in page loads attempting to insert parser-blocking script via document.write** over a 3 month period

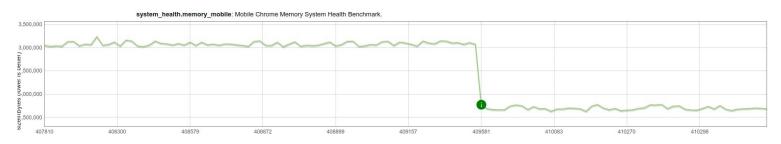

Desktop power reduction

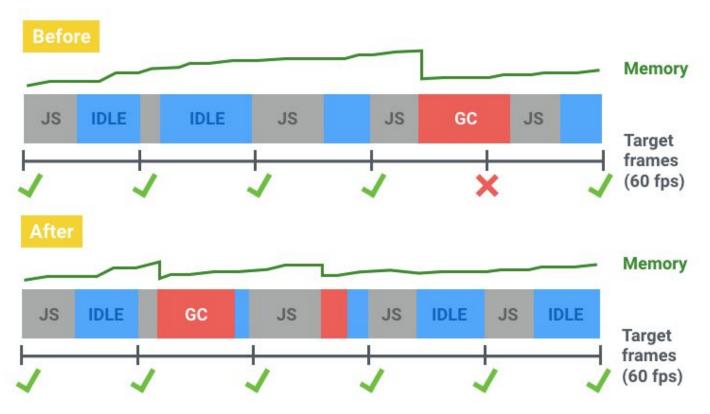

Font glyph cache optimization

bit.ly/glyph-cache-optimization

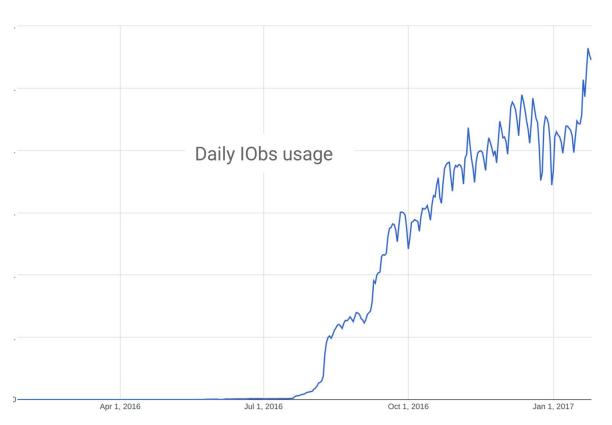

Garbage collection during idle time

Intersection Observer

Lighthouse

DELLE

Progressive Web App

These audits validate the aspects of a Progressive Web App.

App can load on offline/flaky connections

Ensuring your web app can respond when the network connection is unavailable or flaky is critical to providing your users a good experience. This is achieved through use of a Service Worker.

The service worker is the technology that enables your app to use many Progressive Web App features, such as offline, add to homescreen, and push notifications. <u>Learn more</u>.

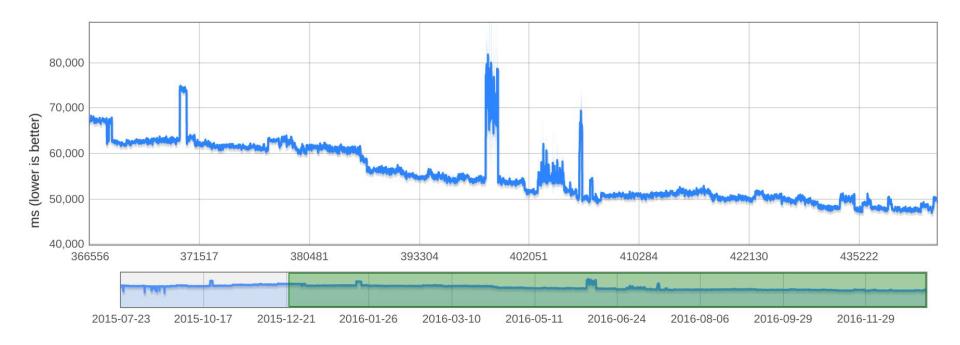

No active service worker found for this origin.

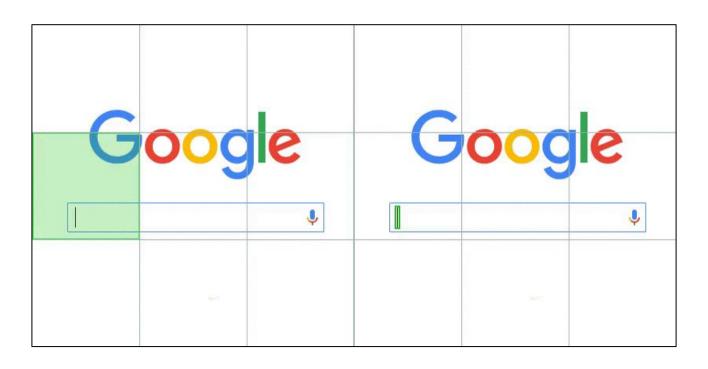

If you're building a Progressive Web App, consider using a service worker so that your app can work offline. Learn

Speedometer & script startup improvements

Partial tile redraw (& more!)

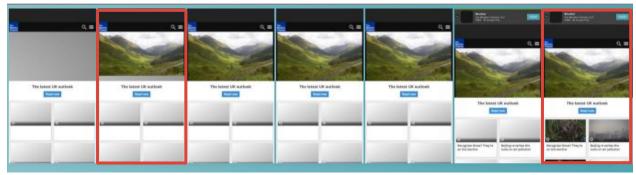

Performance Guided Optimization (PGO)

- 14.8% improvement in NTP load time
- **5.9%** improvement in time to first paint
- 16.8% improvement in startup time

Progressive Web Metrics

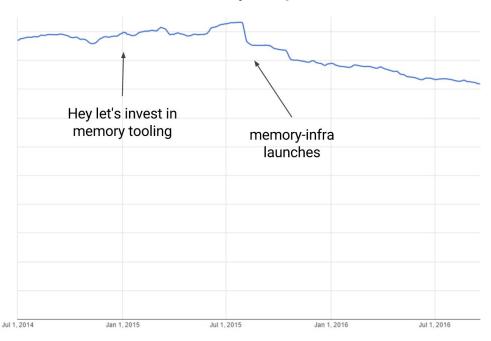

Simplified pages with Data Saver

Sustained Android memory reduction

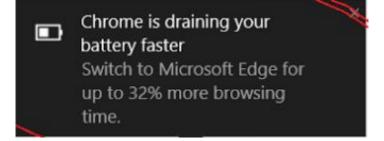

Median memory usage on Android

2017 Challenges & Opportunities

Windows

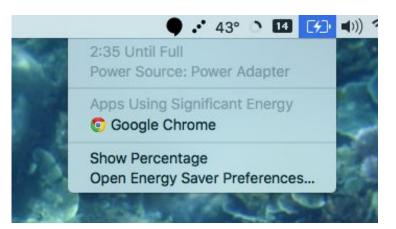

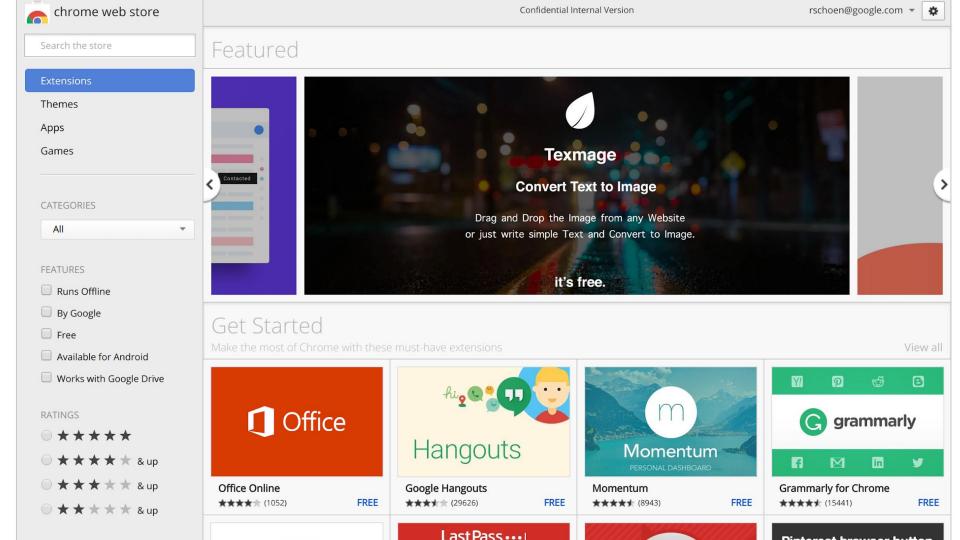

Aw, Snap!

Something went wrong while displaying this webpage.

Mac

Android

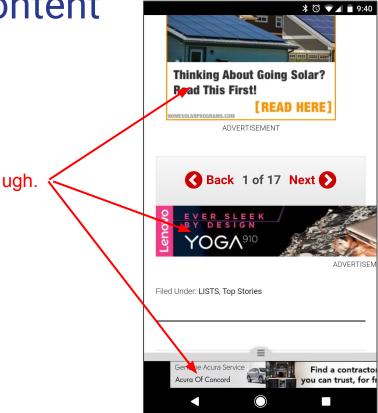

...but especially memory and responsiveness.

Emerging Markets

Third-party content

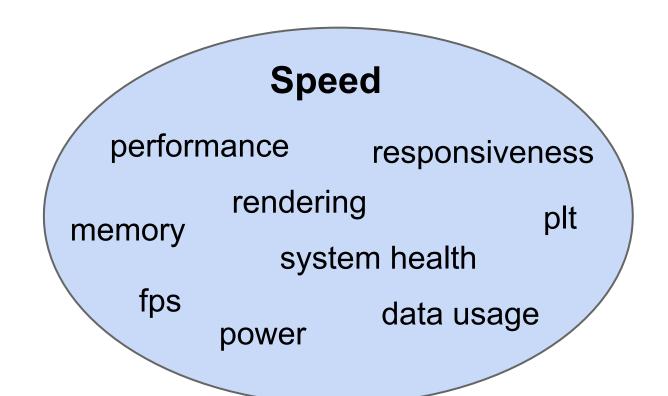

But how?!

The Chrome Speed Program

Chrome-level 2017 goals

- 1) Continue to understand our performance.
- 2) Stop performance regressions from hitting our stable users.
- 3) Build an architecture for Chrome Speed.

In other words...

Analytics

Operations

Architecture

Continue to understand our performance

We all use the same [great] metrics to evaluate impact

Analytics

- Get breakdowns of all our metrics. And, do way deeper analysis!
- Make our real world data actionable

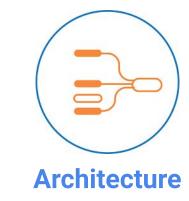

Stop performance regressions

- Audit and dramatically reduce the 224 unmaintained, noisy benchmarks
- Perf waterfalls are constantly red. Fix that for good.
- Extend the Android System Health process into a Chromewide Speed Releasing process across all platforms and all key performance metrics.

Build an architecture for Chrome Speed

 One way to measureme and coordinate memory, CPU, net resources

- Fewer and more coherent architecture projects: we have 16
- Get some big wins for our users via making smart tradeoffs: memory for speed, etc

Can these all become a "global resource coordinator"?
